SATYA ACHANTA

Senior Software Engineer | AI-Forward Full-Stack Engineer
Michigan, USA | itsmesatya.info | satya.achantavenkata@gmail.com | linkedin.com

SUMMARY

Senior Full-Stack Engineer with 10+ years of experience building scalable web platforms, APIs, and AI-forward products. Skilled across React, Python, Java/Spring, PostgreSQL, AWS, Kubernetes, and CI/CD, with strong experience in OpenAI-powered features, RAG workflows, and AI-assisted development. Proven track record driving architecture decisions, improving engineering standards, mentoring engineers, and accelerating product delivery.

TECHNICAL SKILLS

Languages & Frameworks: React, JavaScript, TypeScript, Python, Java, Next.js
Backend & Data: PostgreSQL, Prisma, ORM tools, database design, API development
AI & Intelligent Systems: OpenAI API, AI-assisted development workflows, AI product engineering practices, Automation using AI agents
Cloud & DevOps: AWS, AWS Lambda, Step Functions, Docker, Kubernetes, GitLab CI, GitHub Actions, Jenkins, CI/CD
Frontend & Architecture: GraphQL, Tailwind CSS, ShadCN UI, Design Systems, frontend architecture standards, responsive application design

EXPERIENCE

ITHAKA — Senior Software Engineer

Ann Arbor, MI | Nov 2019 – Present

- Act as a lead-minded engineer across admin portals, reporting workflows, and public APIs, driving architecture decisions, influencing roadmap direction, and owning ambiguous initiatives end to end.
- Led architectural modernization efforts by decomposing legacy services into AWS Lambda- and Step Functions-based workflows, improving scalability and reducing operational overhead.
- Improved release velocity by **3×** through AI-assisted development workflows that accelerated feature implementation, debugging, testing, and developer self-sufficiency.
- Applied AI-enabled engineering practices using tools such as Codex and Copilot for code scaffolding, refactoring, testing, and full-stack feature implementation.

- Contributed to early-stage team AI engineering practices by creating skills and instructions that helped AI tools understand repo conventions, generate tests in the team's style, and support onboarding.
- Encouraged team adoption of AI-assisted workflows and helped shape expectations for reviewing AI-generated code responsibly and effectively.
- Drove engineering standards through clearer repo patterns and conventions, stronger testing standards, improved code quality/linting, and more consistent frontend architecture decisions across features.
- Mentored junior and mid-level engineers through debugging support, design reviews, onboarding, and day-to-day technical guidance.
- Partnered with product owners and stakeholders to shape technical roadmaps, proactively identify delivery risks, and reduce execution bottlenecks.
- Designed and maintained scalable CI/CD pipelines using GitHub Actions, GitLab, Jenkins, Docker, and Kubernetes to improve deployment reliability and reduce manual intervention.
- Introduced a real-time user feedback mechanism that reduced the customer feedback loop by 50%, enabling faster iteration and more informed product decisions.

Infor — Software Engineer

Ann Arbor, MI | May 2015 – Nov 2019

- Built and maintained enterprise-grade applications for automotive clients using Angular and Java (Spring), supporting high-volume, business-critical workflows.
- Partnered closely with the Principal Architect to review designs, evaluate tradeoffs, and improve long-term maintainability across multiple modules.
- Led frontend modernization efforts across legacy Angular codebases, introducing linting and coding standards that improved consistency and reduced defects.
- Optimized data access layers using Hibernate and SQL, improving reporting performance and data reliability.
- Contributed to Agile delivery and CI practices through automated testing and Jenkins pipelines, helping enable more predictable releases and stronger code quality.

PROJECTS

Fantasy League MichCA / michcausa.org — Product Builder

Production product

- Conceived, architected, and delivered a production-grade fantasy sports platform, owning the full product lifecycle from ideation and UX design to deployment and ongoing optimization.
- Designed a serverless full-stack architecture using Next.js, Prisma, and Neon Postgres, reducing match-result computation time from **30 minutes to 15 seconds**.

- Built core product capabilities including admin workflows, leaderboards, database design, Excel ingestion flows, and a mobile-responsive application experience.
- Developed admin workflows for managing users and teams and handling weekly operations, reducing operational effort for league administration.
- Designed data models for historical fantasy picks by user/week, leaderboard and scoring history, and team/user relationships, enabling downstream analytics and AI-based analysis.
- Built a production-ready AI analysis feature using the **OpenAI API** that evaluates users' historical fantasy picks and generates strengths, weaknesses, recommendations, and relative standing compared with other participants.
- Implemented the AI workflow by aggregating structured historical data from the database and sending it to the OpenAI API for LLM-generated analysis over structured inputs.
- Drove the AI feature end to end as the product builder, covering product design, backend integration, data flow, and user experience.
- Continuously monitored performance, iterated on APIs and data models, and optimized the platform for sustainable growth and low operational overhead.

CERTIFICATIONS

Certified Kubernetes Application Developer (CKAD)
Certification ID: LF-hfc7lb3taq

Certified Backstage Associate (CBA)
Certification ID: LF-sa3hh6zbfo

EDUCATION

Master of Science in Computer Science
Eastern Michigan University
2013 – 2015 | GPA: 3.75
